You are given an array **arr**(0-based indexing). The size of the array is given by **n**. You need to **delete** an **element** at given **index** and print the **modified** array. The arr[i] of array is initially set to i+1.

Deletion means you need to shift all the elements after that index to the left by 1 position and set the last element as zero.

Example 1:

Input:

n = 5
index = 0

Output: 2 3 4 5 0

Example 2:

Input:

n = 6
index = 3

Python3 ▾
