Given a big positive number **x** represented as string, find value of $x \% 11$ or $x \bmod 11$.
Output is expected as an integer.

Example 1:

Input: $x = 1345$
Output: 3
Explanation: $1345 \% 11 = 3$

Example 1:

Input: $x = 231456786543567898765$
Output: 1
Explanation: $231456786543567898765 \% 11 = 1$

Your Task:
You don't need to read input or print anything. Your task is to complete the function

Python3

Start Timer

```
1 #User function Template for python3
2
3
4 class Solution:
5     def xmod11(self,x):
6         #code here
7         # return int(x)% 11
8         l = len(x)
9         num=0
10        rem=0
11        for i in range(0,l):
12            num = num*10+ int(x[i])
13            rem = num%11
14        return rem
15
16
```
